Cryptology HW 6 Solutions
Due *Friday*, October 13 at 4 PM

1. Let m be an integer, and let x be an integer with $\gcd(x, m) = 1$. Prove that $x^{\phi(m)-a}$ is an inverse of $x^a \pmod m$.

Solution: We see that $x^{\phi(m)-a}x^a = x^{\phi(m)-a+a} = x^{\phi(m)} \equiv 1 \pmod m$, so by definition $x^{\phi(m)-a}$ is an inverse of $x^a \pmod m$.

2. Compute:

- (a) $\text{ord}_{13} 5$
- (b) $\text{ord}_{13} 7$
- (c) $\text{ord}_{13} 2$
- (d) $\text{ord}_2 127$

Solution:

- (a) 5, 12, 8, 1 so $\text{ord}_{13} 5 = 4$.
 - (b) 7, 10, 5, 9, 11, 12, 6... so $\text{ord}_{13} 7 = 12$.
 - (c) 2, 4, 8, 3, 6, 12, 11... so $\text{ord}_{13} 2 = 12$.
 - (d) $\text{ord}_2 127 = \text{ord}_2 1 = 1$.
3. (a) What is the inverse of 19 mod 96?
(b) Use your answer in part (a) to solve the congruence $x^{19} \equiv 36 \pmod{97}$.

Solution:

- (a) $19 \cdot 5 = 95 \equiv -1 \pmod{96}$ so $-5 \equiv 91$ is the inverse of 19 mod 96.
- (b)

$$\begin{aligned}x^{19} &\equiv 36 \pmod{97} \\(x^{19})^{91} &\equiv 36^{91} \pmod{97} \\x &\equiv 36 \pmod{97}.\end{aligned}$$

4. Suppose Alice and Bob are using the prime $p = 1373$ and the base $g = 2$ for an ElGamal cryptosystem.

- (a) Alice chooses $a = 947$ as her private key. What is the value of her public key A ?

- (b) Now suppose Bob chooses $b = 716$ as his private key, and thus his public key is $469 \pmod{1373}$. Alice encrypts the message $m = 583$ using the ephemeral key $k = 877$. What is the ciphertext Alice sends to Bob?
- (c) Alice chooses a new private key $a = 299$ with associated public key $A \equiv 34 \pmod{1373}$. Bob encrypts a message and sends the ciphertext $(c_1, c_2) = (661, 1325)$. What is the message?

Solution:

- (a) $2^{947} \equiv 177 \pmod{1373}$.
- (b) We have $c_1 \equiv g^k \equiv 2^{877} \equiv 719 \pmod{1373}$ and $c_2 \equiv mA^k \equiv 583 \cdot 469^{877} \equiv 623 \pmod{1373}$. So the ciphertext is $(719, 623)$.
- (c) We compute $x \equiv c_1^a \equiv 661^{299} \equiv 645$, and then compute $x^{-1} \equiv 661^{1372-299} \equiv 794 \pmod{1373}$. Finally we compute $c_2x^{-1} = 1325 \cdot 794 \equiv 332 \pmod{1373}$ so this is the message.
5. Alice publishes an RSA public key with modulus $N = 2038667$ and exponent $e = 103$.
- (a) Bob wants to send Alice the message $m = 892383$. What ciphertext does he send her?
- (b) Alice knows that N factors into two primes, one of which is 1301. What is her decryption exponent d ?
- (c) Some time later, Alice receives the ciphertext $c = 317730$ from Bob. What is the message?

Solution:

- (a) Bob computes $c \equiv m^e \equiv 45293 \pmod{N}$.
- (b) $N = pq = (1301)(1567)$. Thus $M = (1300)(1566) = 2035800$. We want to compute d the inverse of e modulo M , so $d \equiv 810367 \pmod{M}$.
- (c) Alice computes $c^d \equiv 317730^{810367} \equiv 514470 \pmod{N}$.
6. Suppose Eve knows that $N = pq = 352717$, and also intercepts the fact that $(p-1)(q-1) = 351520$. Can you determine $p+q$ from this? Can you determine p and q ?

Solution: We have $pq = 352717$ and $(p-1)(q-1) = pq - p - q + 1 = 351520$. Subtracting the second from the first gives us $p+q-1 = 1197$ so $p+q = 1198$.

From here it's not too tough to find p and q by trial multiplication, and we see that $p = 521, q = 677$ (or vice versa).

Alternatively, we can observe that $pq = p(1198-p) = 352717$, which gives the quadratic $p^2 - 1198p + 352717 = 0$. Solving this gives the two roots 521 and 677.
