**Problem 1.** Suppose a particle has height as a function of time given by  $h(ts) = (2t^3 - 3t^2 - 12t + 3)$  m.

- (a) What is the velocity of this particle at time  $t = 0$ ? What are the units, and why?
- (b) What is the acceleration of this particle at time  $t = 0$ ? What are the units and why?
- (c) When is the particle speeding up? When is it slowing down?

**Problem 2.** Suppose that  $p(t) = 10 - 2t$  is momentum (in kg m/s) of a ball thrown directly upwards, as a function of time (in seconds).

- (a) What units does the derivative  $p'(t)$  take as input? What units are its output? (Do you know of any physical quantity that's represented by those units?)
- (b) What does the derivative  $p'(t)$  represent physically? What would it mean for  $p'(t)$  to be big, or small?
- (c) Calculate  $p'(3)$ . What does this tell you? What physical observation could you measure to check if your calculation was correct?

**Problem 3.** Suppose the cost of buying  $m$  machines is  $C(m) = 500 + 10m + .05m^2$ . There's some start-up cost to having any machines at all; then each machine costs a bit more than the previous one.

- (a) What are the units of the inputs to the function  $C$ ? What are the units of the outputs?
- (b) What is  $C(1)$ ?  $C(10)$ ?  $C(100)$ ?

- (c) Find a formula for  $C'(m)$ . What are the units of the input and output to  $C'(m)$ ?
- (d) What is  $C'(10)$ ? How should we interpret this number?
- (e) What is the *average* cost per machine when you have ten machines? How does this compare to your previous answer?
- (f) What is  $C''(m)$ ? What are the units? What is  $C''(10)$  and how should we interpret it?

**Problem 4** (Bonus). Let  $Q(p) = 10000 - 10p$  give the number of widgets you can sell at a given price  $p$ .

- (a) If you set a price of \$100, how many widgets will you be able to sell? What if you set a price of \$1000?
- (b) What is the derivative of  $Q$ ? What are its units?
- (c) What is  $Q'(100)$  and what does that tell you?

**Problem 5.** Find an equation for the tangent line to  $y = 6 \cos x$  at  $(\pi/3, 3)$ .

**Problem 6.** Find an equation for the tangent line to  $y \cos(x) = 1 + \sin(xy)$  at the point  $(0, 1)$ .

**Problem 7.** Suppose we have some function  $f$  such that  $8f(x) + x^2(f(x))^3 = 24$ , and we know that  $f(4) = 1$ . (Say we've measured this experimentally and now want to understand or compute with the function). Now suppose we want to estimate  $f(5)$  (without having to solve the equation).

- (a) Use implicit differentiation on the equation  $8f(x) + x^2(f(x))^3 = 24$  to find a formula relating  $x$ ,  $f(x)$  and  $f'(x)$ .
- (b) Use this formula to determine  $f'(4)$ .
- (c) Find a formula for the linear approximation of  $f$  near 4.
- (d) Estimate  $f(5)$ .

**Problem 8** (Bonus). (a) If  $\sqrt{xy} = x^2y - 2$ , find a formula for  $\frac{dy}{dx}$  in terms of  $x$  and  $y$ .

- (b) Find an equation of the tangent line at the point  $(1, 4)$ .
