**Problem 1.** Let  $g(x) = x \tan(x)$ . We want to sketch a graph of  $g$ .

1. What is the domain of  $g$ ?
2. For simplicity, let's just look at  $[-\pi/2, \pi/2]$ . What can you say about any asymptotes it has?
3. Does this function have any roots you can find?
4.  $g'(x) = \frac{\sin(x) \cos(x) + x}{\cos^2(x)}$ . What are the critical points?  
(Hint: when is  $\sin(x) \cos(x)$  positive and when is it negative?)
5. What are the critical values?
6. Where is  $g$  increasing and decreasing? Does it have maxima or minima?
7.  $g''(x) = 2 \sec^2(x)(1 + x \tan(x))$ . Where are the potential points of inflection, and what are their values? Where is  $h$  concave up and down?
8. Sketch the graph.

**Solution:**

1. The domain of  $g$  is real numbers except  $n\pi + \pi/2$ .
2. In  $[-\pi/2, \pi/2]$  we can't include the endpoints so we now have  $(-\pi/2, \pi/2)$ .  $\lim_{x \rightarrow -\pi/2^+} g(x) = +\infty$  and  $\lim_{x \rightarrow \pi/2^-} g(x) = +\infty$ , which gives us asymptotes.

3. The function is 0 when  $x = 0$  (and when  $x = n\pi$  if we look farther out).
4.  $g'(x) = \tan(x) + x \sec^2(x) = \frac{\sin(x)\cos(x)+x}{\cos^2(x)}$ . It's not hard to see that when  $-\pi/2 < x < 0$  then  $g'(x) < 0$ , and when  $0 < x < \pi/2$  then  $g'(x) > 0$ , and  $g'(0) = 0$ . So the only critical point is at 0.
5.  $g(0) = 0$ .
6. And we saw that  $g$  is decreasing on  $(-\pi/2, 0)$  and increasing on  $(0, \pi/2)$ . Thus  $g$  has a local minimum at 0.  $g(0) = 0$ .
7.  $x \tan x \geq 0$  on  $(-\pi/2, \pi/2)$ , so  $g''(x) \geq 0$  on  $(-\pi/2, \pi/2)$ , so the function is concave up everywhere.
- 8.

**Problem 2.** Let  $h(x) = \frac{x+2}{x-1}$ . We want to sketch a graph of  $h$ .

1. What is the domain of  $h$ ? What can you say about any asymptotes it has?
2. Does this function have any roots? Where?
3. What happens as  $x$  approaches  $+\infty$ ?  $-\infty$ ?
4.  $h'(x) = -3(x-1)^{-2}$ . What are the critical points and values?
5. Where is  $h$  increasing and decreasing? Does it have maxima or minima?
6.  $h''(x) = 6(x-1)^{-3}$ . Where are the potential points of inflection? Where is  $h$  concave up and down?
7. Sketch the graph.

**Solution:**

1. The domain of  $h$  is all real numbers except 1. We see that  $\lim_{x \rightarrow 1^-} h(x) = -\infty$  and  $\lim_{x \rightarrow 1^+} h(x) = +\infty$ .
2. The function has a root at  $x = -2$ .
3. We have  $\lim_{x \rightarrow +\infty} h(x) = \lim_{x \rightarrow -\infty} h(x) = 1$ . (We can use L'Hôpital's rule or divide the top and bottom by  $x$ ).
4. We have  $h'(x) = \frac{(x-1)-(x+2)}{(x-1)^2} = -3(x-1)^{-2}$ . This has no roots and fails to exist when  $x = 1$ . Thus there are no "real" critical points.
5. We make a chart for increase and decrease:

	$-3$	$(x-1)^{-2}$	$h'(x)$
$x < 1$	-	+	-
$1 < x$	-	+	-

Thus  $h$  is decreasing everywhere. It has no local maxima or minima.

6.  $h''(x) = 6(x-1)^{-3}$  is positive when  $x > 1$  and negative when  $x < 1$ , so it is concave down on the left, and concave up on the right.

Figure 0.2: The graph of  $h(x) = \frac{x+2}{x-1}$

**Problem 3 (Bonus).** Let  $g(x) = x^5 - 4x^3 + 4x + 7$ . We want to sketch a graph of  $g$ .

1. What is the domain of  $g$ ? What can you say about any asymptotes it has?
2. Does this function have any roots you can find?
3. What happens as  $x$  approaches  $+\infty$ ?  $-\infty$ ?
4.  $g'(x) = 5x^4 - 12x^2 + 4$ . What are the critical points?

(Hint: if we set  $u = x^2$  this becomes a quadratic, and we can factor it.)

5. What are the critical values?

(Hint:  $g(x) = 7 + x(x^4 - 4x^2 + 4) = 7 + x(u^2 - 4u + 4)$ .)

6. Where is  $g$  increasing and decreasing? Does it have maxima or minima?

7.  $g''(x) = 20x^3 - 24x$ . Where are the potential points of inflection, and what are their values? Where is  $h$  concave up and down?

8. Sketch the graph.

### Solution:

1. The domain of  $g$  is all reals. There are no asymptotes.

2. This function has one real root, but good luck finding it without a computer.

3.  $\lim_{x \rightarrow +\infty} g(x) = +\infty$  and  $\lim_{x \rightarrow -\infty} g(x) = -\infty$ .

4. The derivative is defined everywhere. We can work out that if  $u = x^2$  we have

$$4x^5 - 12x^2 + 4 = 5u^2 - 12u + 4 = (5u - 2)(u - 2) = (5x^2 - 2)(x^2 - 2)$$

so the derivative has four roots: where  $x^2 = 2$  and where  $x^2 = 2/5$ . Thus the critical points are  $x = \pm\sqrt{2}$  and  $x = \pm\sqrt{2/5}$ .

5.

$$g(-\sqrt{2}) = 7 - \sqrt{2}(4 - 8 + 4) = 7$$

$$g(\sqrt{2}) = 7 + \sqrt{2}(4 - 8 + 4) = 7$$

$$g(-\sqrt{2/5}) = 7 - \sqrt{2/5} \left( \frac{4}{25} - \frac{8}{5} + 4 \right) = 7 - \sqrt{2/5} \cdot \frac{64}{25}$$

$$g(\sqrt{2/5}) = 7 + \sqrt{2/5} \left( \frac{4}{25} - \frac{8}{5} + 4 \right) = 7 + \sqrt{2/5} \cdot \frac{64}{25}$$

6. We can make a chart:

	$5x^2 - 2$	$x^2 - 2$	$g'$
$x < -\sqrt{2}$	+	+	+
$-\sqrt{2} < x < -\sqrt{2/5}$	+	-	-
$-\sqrt{2/5} < x < \sqrt{2/5}$	-	-	+
$\sqrt{2/5} < x < \sqrt{2}$	+	-	-
$\sqrt{2} < x$	+	+	+

So  $f$  is increasing on  $(-\infty, -\sqrt{2}) \cup (-\sqrt{2/5}, \sqrt{2/5}) \cup (\sqrt{2/5}, +\infty)$  and is decreasing on  $(-\sqrt{2}, -\sqrt{2/5}) \cup (\sqrt{2/5}, \sqrt{2})$ .

$g$  has local maxima at  $(-\sqrt{2}, 7)$  and at  $(\sqrt{2/5}, 7 + \sqrt{2/5} \cdot \frac{64}{25})$ . It has local minima at  $(-\sqrt{2/5}, 7 - \sqrt{2/5} \cdot \frac{64}{25})$  and  $(\sqrt{2}, 7)$ .

7.  $g''(x) = 4x(5x^2 - 6)$  so the possible points of inflection are 0 and  $\pm\sqrt{6/5}$ . We compute

$$g(-\sqrt{6/5}) = 7 - \sqrt{6/5} \left( \frac{36}{25} - \frac{24}{5} + 4 \right) = 7 - \sqrt{6/5} \cdot \frac{16}{25}$$

$$g(0) = 7$$

$$g(\sqrt{6/5}) = 7 + \sqrt{6/5} \left( \frac{36}{25} - \frac{24}{5} + 4 \right) = 7 + \sqrt{6/5} \cdot \frac{16}{25}$$

To find concavity we can make another chart:

	$4x$	$5x^2 - 6$	$g'$
$x < -\sqrt{5/6}$	-	+	-
$-\sqrt{6/5} < x < 0$	-	-	+
$0 < x < \sqrt{6/5}$	+	-	-
$\sqrt{6/5} < x$	+	+	+

So  $g$  is concave upwards on  $(-\sqrt{6/5}, 0) \cup (\sqrt{6/5}, +\infty)$ , and concave downwards on  $(-\infty, -\sqrt{6/5}) \cup (0, \sqrt{6/5})$ . (So all the potential points of inflection are in fact points of inflection.)

8.

Figure 0.3: The graph of  $g(x) = x^5 - 4x^3 + 4x + 7$ . Critical points in red, and points of inflection in black.
